

reversible: a tenant moves back, a feature reads from its old source

irreversible, so last

1 Register
every feature
and model,
with its owner
and definition

2 Serve
one accel-
erator pool;
teams move
as tenants

3 Compute
one feature
store; old and
new computed
side by side

4 Compare
served values
against the
old, per
feature, for
a quarter

**5 Switch off
the team's
own
pipeline**

old and new definitions served side by side

a retrain ships only past its judged set

never a big-bang cutover: a feature that
differs at the fourth decimal is a silent
regression in every model that reads it
